time management. There is no magic

formula here. You cannot stretch the

hours available to you. Here it is a

Getting organized is the essence of ing to what they are paid for, which is is something familiar p everyone managing.

> To help organize work, one can keep a To Do List (also known as a Master List), a Daily Planner and a register, or diary, to record important telephone conversations. These are the veritable tools of time management, techniques and methods that help a manager get organized and keep track of works, tasks and projects.

numbers quickly when required. This is of course separate from the diary or register meant to record telephone conversations.

them. One can keep a medium size notebook with left side reserved for tasks and the facing page for the action required and/or taken.

Lists can be periodically updated when a sufficient number of task are completed, and the incomplete tasks carried over to a fresh list. Fo tasks that require a longer time t accomplish, this list can be supple mented by a Daily Planner. In th Daily Plan ner, one can recor appointments, start dates of lon One can and should cus- running projects, keep track c tomize one's own works delegated to subordinates an

allotted time Since the most important task of a manager is to make the best use of the resources at his disposal. And time, alongwith men, materials and money, is an important resource. Making an effective use of these resources is the trait of every good manager.

plain of lack of time. For them

However, unlike other (physical) resources, time is an intangible of various tasks. resource. Probably that is why many managers don't realize of its importance as a resource and fail to use it effectively. The problem of time management usually starts when managers decide to devote their costly time to simple routines. Work that rate folder for can be done by other staff members, papers often takes up the precious time of a manger. Reasons for this may range from lethargy, failure to schedule tasks in accordance with their priority to simply the manager being incompetent. But the impact is the same, viz the tasks more in need of getting accomplished remain unfinished and productivity suffers as a result.

The answer to increasing productivity is time management. One can tailor or customize the basic principles of time management to one's needs and get more work done in less time. This also involves less effort and a result that is tangible. Time, management is aimed at getting the important tasks done first, to enhance productivity.

As they say, in a business setting, time is money. If a manager uses time a good manager to devote more of his

resource that everyone gets an equal share of. A lot of time is wasted in just retrieving files, papers or other paraphernalia when they are required. So the first thing should be to organize, classify, and record papers appropriately in the right order. Of course such a step will help you retrieve files easily and quickly as and when necessary, thus saving time. The principles of organization are to: * Classify things.

* Arrange letters, reports, etc. subject-wise in separate folders.

* Throw away unnecessary papers clutter is the antithesis of organization.

* Set priorities Nothing is more wasteful than running around in circles just to get a work done.

* Keep a sepaunder action.

With regard to delegation, it is important to know what task to delegate to subordinates. While it is important not to overburden oneself with tasks that can be handled by others, discretion should be exercised in delegating work because not every work can be delegated. Delegate work that is capable of being handled by the subordinate to whom it is delegated. Both these practices are damaging: delegating work to subordinates who are not capable of doing it, and doing things by yourself that can easily be done by subordinates. In fact, it is the duty of ffectively, not only will he be able to time to management side for which

orities are set and deadlines noted. * In the Daily Planner, priorities of

is almost freely available these days, can also help one to record things and carry out specific functions, such as accounting, to organize work, keep records and save time. However, the computer should not be regarded as a magic box to accomplish tasks. The same basic principles apply to working with computer files as to paper files.

Data has to be properly classified and in addition files and folders named meaningfully to help retrieve them easily when needed. it is also necessary that the computer be kept

sary as electronic data is liable to get damaged and can also get lost by getting wiped out inadvertently.

For large production and construction projects, there are the specifically useful techniques of the Critical Path Method (CPM) and the Performance Evaluation and Review Techniques (PERT). These depend on analyzing complex tasks into their several simpler components or 'steps'. The complex project is broken up into its component parts and their inter-relationship determined. Some of these will be found to depend on other tasks, which will be the 'pre-requisites' for these tasks and must be accom-

plished first in order to be able to begin the dependent tasks. Also, some components may be independent but accomplishing them first sometimes achieves nothing in term of overall time schedule because of their place in the overall sequence. All these things have to be kept in mind.

At the same time all theories and textbook advice aside, one needs common sense and an analytical but practical approach to be able to use time to his advantage. As an example, we should take a look at the person who mends punctured tires. He is one who makes the best of his time by doing several jobs at the same time, thus getting the most of his time.

For all this record keeping to be effective, there should be a constant feedback and evaluation of results. This should consist of an ongoing evaluation of techniques against accomplishment of objectives and meeting deadlines. Feedback from superiors, subordinates and peers should be taken to help determine the effectiveness of techniques. As one uses the techniques, one learns, through practices and by trial and error. Subordinates should be encouraged to work collectively and make the most of their for the boss, or the senior
